Submitted (06-JUL-1998) Joint Genome Institute, Lawrence Livermore National Laboratory, 7000 East Ave., Livermore, CA 94551, USA Map and sequence oriented from p telomere to centromere. Cosmid R30783 is located between fosmid 37308 to the left and fosmid 39554 to the right. Currently there is a sequence gap of approximately 3.5 kb between R30783 and FOS37308, and of <1 kb between R30783 and FOS37308, and of <1 kb between R30783 and FOS3554. Additional map and sequence information may be obtained at: http://www-blo.llnl.gov/bbrp/genome/genome.html.

New cysteinerich soluble proteins - used to modulate proliferation, and defending and development of cells, e.g. for treating inflammation, cancer and degeneration

Treating inflammation, cancer and degeneration

Claim 1; page-T8-19; 119pp; English.

The profent Sequence represents a cysteine rich soluble protein (CRSP)

Considered C23_CRSP proteins, and their (ant)agonists, are used to modulate physiology, differentiation, trafficking and development of cells (including those in culture), particularly cells of the mammalian immune system. They are used for treatment of abnormal proliferation (cancer, inflammation or degeneration), regeneration, degeneration and atrophy. The proteins are also used to raise, or detect, antibodies, to design oligonucleotides for library screening, in drug screens and to isolate cognate receptors. The antibodies are used for affinity purification of CRSP, to screen expression libraries, to identify CRSP-expressing cells, as diagnostic immunoassay reagents, competitive drug screens, and as therapeutic modulators. Nergotation of the proteins - used to modulate proliferation, differentiation, trafficking and development of cells, e.g. for treating inflammation, cancer and degeneration

Claim 1: Page 15: 119pp; English.

The present sequence represents a cysteine rich soluble protein (CRSP)

Gesignated C19. CRSP proteins, and their (ant)agonists, are used to modulate physiology, differentiation, trafficking and development of cells (including those in culture), particularly cells of the mammalian immune system. They are used for treatment of abnormal proliferation (cancer, inflammation or degeneration), regeneration, degeneration and atrophy. The proteins are also used to raise, or detect, antibodies, to design oligonucleotides for library screening, in drug screens and to isolate cognate receptors. The antibodies are to identify CRSP-expressing cells, as diagnostic immunoassay reagents, to produce anti-idiotypic antibodies (useful for diagnosis), in competitive drug screens, and as therapeutic modulators.

useful for diagnosis and treatment of e.g. neurological disorders,

useful for diagnosis and treatment of e.g. neurological disorders,

tumnours, immune disorders, inflammation or haematological disorders

Claim 11: Page 190: 215pp: English.

X12914-68 represent human secreted proteins. The polypeptides and
their corresponding polynuclectides are useful for preventing.

Creating or ameliorating medical conditions, e.g. by protein or gene
therapy. Pathological conditions can also be diagnosed by determining
the amount of the new polypeptides in a sample or by determining the
presence of mutations in the new polynucleotides. Specific uses are
described for each polynucleotide, based on which tissues they are
most highly expressed in, and include developing products for the
diagnosis or treatment of cancer, immune disorders, infection,
inflammatory disorders, skin disorders, tumours, atherosclerosis,
restenosis, autoimmune disorders, neurological disorders, arthritic
disorders, skeletal disorders, neurological disorders, arthritic
clisorders, asthma, immunodeficiency diseases, AIDS and transplant
relection. The polypeptides are also useful for identifying their
hematopoietic disorder; skeletal disorder; neurological disorder; arthritic disorder; asthma; immunodeficiency disease; AIDS; transplant rejection; ss.

ï
of cells (including those in culture), particularly cells of the mammalian immune system. They are used for treatment of abnormal proliferation (cancer, inflammation or degeneration), regeneration, degeneration and atrophy. The proteins are also used to raise, or detect, antibodies, to design oligonucleotides for library screening, in drug screens and to isolate cognate receptors. The antibodies are used for affinity purification of CRSP, to screen expression libraries, to identify CRSP-expressing cells, as diagnostic immunoassay reagents, to produce anti-idiotypic antibodies (useful for diagnosis), in competitive drug screens, and as therapeutic modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  treating inflammation, cancer and degeneration
Claim 1; Page 17; 119pp; English.
Claim 1; Page 17; 119pp; English.

Gasignated Cl0. CRSP proteins a cysteine rich soluble protein (CRSP)
designated Cl0. CRSP proteins, and their (ant)agonists, are used to
modulate physiology, differentiation, trafficking and development
of cells (including those in culture), particularly cells of the
mammalian immune system. They are used for treatment of abnormal
proliferation (cancer, inflammation or degeneration), regeneration,
degeneration and atrophy. The proteins are also used to raise, or
detect, antibodies, to design oligonucleotides for library screening,
in drug screens and to isolate cognate receptors. The antibodies are
used for a fafinity purification of CRSP, to screen expression libraries,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to identify CRSP-expressing cells, as diagnostic immunoassay reagents, to produce anti-idiotypic antibodies (useful for diagnosis), in competitive drug screens, and as therapeutic modulators.

Mr observation, trafficking and development of cells, e.g. for treating inflammation, cancer and degeneration

Claim 1; Page 14; 119pp; English.

Cle present sequence represents a cysteine rich soluble protein (CRSP) designated C18. CRSP proteins, and their (ant)agonists, are used to modulate physiology, differentiation, trafficking and development of cells (including those in culture), particularly cells of the mammalian immune system. They are used for treatment of abnormal proliferation (cancer, inflammation or degeneration), regeneration, degeneration and atrophy. The proteins are also used to raise, or detect, antibodies, to design obligonucleotides for library screening, in drug screens and to isolate cognate receptors. The antibodies are used for affinity purification of CRSP, to screen expression libraries, to identify CRSP-expressing cells, as diagnostic immunoassay reagents, to produce anti-idiotypic antibodies (useful for diagnosis), in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5 LCFLFILVSLFPLIVPGNAQCSFESLVDQRIKEALSRQEPKTIS-----CTSVTSSGRLA 59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4 LCLL--LLPVLGLLVSSKTLCSMEEAINERIQEVAGSLIFRAISSIGLECQSVTSRGDLA 61

Mercycle and the proteins - used to modulate proliferation, aliferentiation, trafficking and development of cells, e.g. for treating inflammation, cancer and degeneration cells, e.g. for treating inflammation, cancer and degeneration claim 1; Page 13: 119pp; English.

The present sequence represents a cysteine rich soluble protein (CRSP) designated C2D. CRSP proteins, and their (ant)agonists, are used to modulate physiology, differentiation, trafficking and development of cells (including those in culture), particularly cells of the mammalian immune system. They are used for treatment of abnormal proliferation (cancer, inflammation or degeneration), regeneration, degeneration and atrophy. The proteins are also used to raise, or detect, antibodies, to design oligonucleotides for library screening, in drug screens and to isolate cognate receptors. The antibodies are used for affinity purification of CRSP, to screen expression libraries, to identify CRSP-expressing cells, as diagnostic immunosasay reagents, in correct anti-idiotypic antibodies (useful for diagnosis), in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5

cerreted proteins, and encode the proteins given in Y1251 to Y1268, respectively. The proteins given in Y1251 to Y1268, respectively. The proteins given represent the signal peptide and an Niteriminal fragment of a secreted protein. The nucleic acid sequences can be used for products for diagnosis and therapy. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/ chemokinetic activity, haemostatic and thrombolytic activity, receptor/ ligand activity, antininiamatory activity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Writing and development of cells, e.g. for treating inflammation, cancer and degeneration

Sub-cortical infarcts and leukoencephalopathy

Claim 2, Fig 11-1.8; 45pp; French.

This sequence represents the human Notch3 protein, a transmembrane receptor protein involved in lateral inhibition and regulating developmental cascades of neurogenic genes. Mutated Notch3 proteins are thought to be involved in neurological disorders, especially of the cerebral autosommant arteriopathy with subcortical infarcts and leukoencephalopathy (CADASIL) type. Blocking expression of a mutated Notch3 gene or by substitution therapy with non-mutated Notch3 gene or protein can be used to treat CADASIL or related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Partial human Notch-3 prótein.
Human: Notch3: transmembrane receptor; lateral inhibition; regulation; Human: Notch3: transmembrane receptor; lateral inhibition; regulation; evelopmental cascade; neurogenic gene; mutant; neurological disorder; cerebral autosomal dominant arteriopathy; subcortical infarct; CADASIL;

pre-disposition to cerebral autosomal dominant arteriopathy with sub-cortical infarcts and leukoencephalopathy
Claim 2; Fig la-1g; 42pp; French.
This sequence represents a partial human notch3 protein, a transmembrane receptor protein involved in lateral inhibition and regulating developmental cascades of neurogenic genes. Mutated Notch3 proteins are thought to be involved in neurological disorders, especially of the cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy (CABASIL) type. Blocking expression of a mutated Notch3 gene or by substitution therapy with non-mutated Notch3 gene or protein can be used to treat CADASIL or related disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-DEC-1996 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                recombinant DNA in endothelial cells
Example 1; Column 6; 26pp; English.
This sequence represents a fragment of the mouse Tie receptor tyrosine
kinase. The invention relates to Tie receptor tyrosine kinase promoters.
The promoters are useful for directing expression of recombinant DNA
sequences in endothelial cells. The promoters are useful for production
of proteins and peptides which act as anticoagulants, vasodilator
inhibitors of thrombosis or restenosis into endothelial cells, blood and
tissues. The promoters are useful for directing expression of proteins
and peptides for human gene therapy, antigens and markers for endothelial
cell tagging, and antisense RNA constructs for use in endothelial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cell tagging, and antisense RNA constructs for use in endothelial cells in vivo and in vitro. The promoters, and vectors and host cells containing them, are useful in gene therapy for promoting expression of various growth factors or receptors or their domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              류

Cell-targetted retroviral vector particles can be used in gene Example 2; Page 36; 73pp; English.
Cell targetted retroviral vector particles can be used in gene therapy to deliver a heterologous gene to a target cell for expression of a heterologous polypeptide in that cell. The cell targetted retroviral vector particles comprise an envelope protein which is modified to contain a targetting polypeptide (a single chain antibody), or in the case of moloney murine leukaemia virus (MOMUV), alpha melanotropin-stimulating hormone (MSH). Two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ------GSWDVRAETIC-----HCQCAGMDWT 99
                                                                                                                                                                                                                                                                                                                                                                                                                                                      oligonucleotides (R98207, R98208) were used to substitute sequences MOMULV for MSH sequences. This oligonucleotide was used to replace residues S74-S91 of MOMULV envelope protein (See W04248).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 99-189653/16.

partic. malignant tissue
Disclosure; Fig 4A; 37pp; English.
The present sequence is the kalinin/laminin 5 gamma-2 chain. The gamma-2 chain is of importance to patients suffering from epidermolysis bullosa, esp. the junctional form (JEB). Probes and antisense gamma-2 sequences esp. the junctional form (JEB). Probes and antisense gamma-2 sequences the invasive growth of cells in tissue, partic. malignant tissue.
Sequence 1193 AA, -----CKNGFYRHRERDRCLPCNCNSK-GSLSARCDNSGRCSCKPGV--TGARCDRC 116 55 TSRGDLATCPRGF-----AVTGCTCGSACGSWDVRAETTCHCQC-AGMDWTGARCCRV 106 cells - useful to of cell in tissue, Detection of Kalinin or laminin 5 expression in cells - useful to detect, monitor and inhibit the invasive growth of cell in tissue, partic. malignant tissue 4 LCLLLLPVLGLLVSSKTLC----SMEEAINERIQEVAGSLIFRAI----SSIGLECQSV 30; 13-NOV-1996 (first entry)

Disclosure; Fig 4B: 37pp; English.

The present sequence is an alternative form of kalinin/laminin 5 gamma-2 chain (see R9147). The gamma-2 chain is of importance to patients suffering from epidernolysis bullosa, esp. the junctional form (JEB). Probes and antisense gamma-2 sequences derived from this sequence can be used to detect, monitor and inhibit the invasive growth of cells in Sequence 1111 AA.

DEWALD G., NOTHEN M.M., CICHON S.;

Polymorphism of human complement component C6: an amino acid
substitution (Glu/Ala) within the second thrombospondin repeat
differentiates between the two common allotypes C6 A and C6 B.";

BIOCHEM. BIOCHEN. RES. COMMUN. 194:458-464(1993).

-I- FUNCTION: INVOLVED IN THE FORMATION OF THE LYTIC C5B-9M COMPLEX.
-I- DOMAIN: C6 CONTAINS NINE DISTINCT STRUCTURAL UNITS (CYSTEINB-RICH)
WHICH HAVE THE CHARACTERISTIC FEATURES OF MODULES.
-I- PTM: ALL CYSTEINE RESIDUES ARE ASSUMED TO BE CROSS-LINKED TO ONE
ANOTHER. INDIVIDUAL MODULES CONTAINING AN EVEN NUMBER OF CONSERVED
CYSTEINE RESIDUES ARE SUPPOSED TO HAVE DISULFIDE LINKAGES ONLY
WITHIN THE SAME MODULE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HABFILIGER J.-A., TSCHOPP J., VIAL N., JENNE D.E.; "Complete primary structure and functional characterization of the sixth component of the human complement system. THIS STRUCTURE IS THEN RECOGNIZED AND BOUND BY PROTEINS PRIB AND PRIC. FORMATION OF THE PRIMOSOME PROCEEDS WITH THE SUBSEQUENT ACTIONS OF DNAB, DNAC, DNAT AND PRIMASE. PRIA THEN FUNCTIONS AS A HELICASE WITHIN THE PRIMOSOME (BY SIMILARITY). SIMILARITY: BELONGS TO THE PRIA SUBFAMILY OF HELICASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TIGR; BB0014; -.

RECH. DEV. 46:123-136(1994).

- FUNCTION: NOTCH 1.2 AND PROBABLY OTHER REGIONS OF THE EMBRYO.

- FUNCTION: NOTCH 1.2 RADLIFERATING NEUROEPITHELIUM.

- TISSUE SPECIFICITY: PROLIFERATING NEUROEPITHELIUM.

- SIMILARITY: CONTAINS 34 EGF-LIKE DOMAINS.

- SIMILARITY: CONTAINS 3 LOOPONING REPEATS.

- SIMILARITY: CONTAINS 5 CDC10/SWIG REPEATS.

- SIMILARITY: CONTAINS 6 CDC10/SWIG REPEATS.

SEPARATION OF NEUROBLASTS FROM THE ECTODERM INTO THE INNER PART
OF EMBRYO IS ONE OF THE FIRST STEPS OF CNS DEVELOPMENT IN INSECTS,
THIS PROCESS IS UNDER CONTROL OF THE NEUROGENIC GENES.
SIMILARITY: HIGH, WITH OTHER NOTCH-TYPE PROTEINS.
SIMILARITY: CONTAINS 3 LIN/NOTCH REPEATS.
SIMILARITY: CONTAINS 6 EGF-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                    MEDLINE; 85099329.

A; Molecule type: protein
A; Mesidues: 1-295 < YAM>
A; Residues: 1-295 < YAM>
A; Experimental Source: root
C; Comment: This protein is a lectin specific for N-acetylgucosamine-containing saccharid
C; Keywords: glycoprotein
F; 96,139/Binding site: carbohydrate (Asn) (covalent) #status predicted
